Chemistry

Lower Secondary level

Chapter One

States of Matter

- 1.1. Basic properties of matter
 - Definition of matter
 - Discovery of the discrete structure of matter
 - Properties of matter: mass, volume, density
- 1.2. Gases
 - Kinetic model of gases
 - Basic properties of gases
 - Explanation of gas properties in terms of the kinetic model
 - Examples
- 1.3. Liquids
 - Kinetic model of liquids
 - Basic properties of liquids
 - Explanation of properties of liquids in terms of the kinetic model
 - Examples
- 1.4. Solids
 - Kinetic model of solids
 - Basic properties of solids
 - Explanation of properties of solids in terms of the kinetic model
 - Examples
- 1.5. Changes of state
 - Physical changes
 - Melting, fusion/freezing
 - Boiling, vaporisation/condensation
 - Sublimation/deposition
- 1.6. Physical changes accompanying heating and cooling
 - Heating and cooling curves
 - Density changes
 - Expansion and contraction
 - Anomalous properties of water
- 1.7. Diffusion and dissolving
 - Diffusion in gases
 - Diffusion in liquids
 - Factors affecting the rate of diffusion
 - Dissolving
 - Factors affecting the rate of dissolving
- 1.8. Gas laws. Part 1.
 - Units of pressure (pascals)
 - Boyle's law
 - Units of temperature (Kelvin)
 - Charles' law
 - Calculations
- 1.9. Gas laws. Part 2.
 - Gay-Lussac's law
 - Combined gas law
 - Calculations

Chapter Two

Elements, compounds and mixtures

- 2.1. Elements
 - Pure substances vs. mixtures
 - Definition of an element
 - Element symbols
 - Metals and non-metals
- 2.2. Chemical compounds
 - A compound as a species built of atoms in specific proportions
 - Experimental formula
 - Molecular formula
 - Properties as compared with the properties of the constituent elements
- 2.3. Mixtures
 - What is a mixture?
 - Test for purity
 - Homogeneous mixtures
 - Heterogeneous mixtures
 - Examples

Chapter Three

Atomic structure

- 3.1. Early atomic theories
 - Billiard-ball model (Dalton)
 - Discovery of smaller particles (electron, proton, neutron)
 - Plum-pudding model (Thomson)
 - Gold-foil experiment
 - Rutherford's model
- 3.2. The structure of the atom
 - Elementary particles
 - Nucleus
 - Atomic number
 - Mass number
 - Representation of atomic number and mass number
 - Isotopes: definition and symbolic representation
 - Prediction of the number of elementary particles in an isotope
- 3.3. Relative atomic mass
 - Definition of amu
 - Relative mass scale
 - Why the atomic mass expressed in amu for elements is usually not an integral value
 - Calculations of isotope composition from atomic mass and vice versa
- 3.4. Continuous and line spectra
 - Continuous spectrum
 - Line spectrum of hydrogen
 - Spectra of other atoms
- 3.5. Bohr's model.
 - Construction of the atom according to Bohr
 - Energy levels
 - Excitation of electrons
 - Emission of light
 - Ionisation

- 3.6. **Electron configuration**
 Rules for filling the energy levels
 Elements and their names
 Arrangement of elements in the periodic table
 Finding the electron configuration based on position in the periodic table
 Formation of positive and negative ions
 Ion formation and reactivity versus position in the periodic table

Chapter Four **Bonding**

- 4.1. **Ionic bonding. Part 1**
 Stable electron configuration (neon)
 Cation formation (sodium)
 Anion formation (chlorine)
 Reaction between sodium and chlorine
 Properties of sodium chloride
 Structure of sodium chloride in the solid state
 Attractive forces in the lattice of sodium chloride
- 4.2. **Ionic bonding. Part 2**
 Ion formation vs. position in the periodic table
 Schematic representation of ionic compounds
 Naming of ionic compounds
 Determining the formula of ionic compounds
 Ionic compounds of transition metals
 Giant structure of ionic crystals: structure, bonding, melting point, hardness, conductivity, solubility,
- 4.3. **Covalent bonding. Part 1**
 Electron sharing
 Covalent bonds
 Bonds in molecules of diatomic elements
 Structural diagrams
 Dot-and-cross diagrams for covalent compounds
- 4.4. **Covalent bonding. Part 2**
 Tendency to form covalent bonds vs. position in the periodic table
 Bonding between carbon atoms
 Double and triple bonds
 Valency
 Covalent bonding in polyatomic ions
 Determining the charge of a polyatomic ion
 Determining the composition of an ionic compound made of polyatomic ions
- 4.5. **Simple and giant molecular solids**
 Structure, bonding, melting point, hardness, conductivity, solubility, examples
- 4.6. **Allotropes**
 Definition
 Allotropes of carbon
 Allotropes of oxygen
 Allotropes of sulphur
- 4.7. **Metallic bond**
 Structure of metallic crystals
 Attractive and repelling forces in the crystal lattice
 Examples of metals
 The properties of metals reflect their inner structure

- 4.8. **Alloys**
 Definition
 Inner structure
 Why alloys are usually stronger than pure metals
 Examples of alloys: steel, stainless steel, brass, bronze, duralumin, solder (optionally: precious-metal alloys, wood's alloy)

Chapter Five **Representing chemical reactions**

- 5.1. **Chemical and physical change**
 Definitions
 Features of chemical change
 Examples
 Distinguishing chemical from physical changes
- 5.2. **Chemical equations**
 Representation of a chemical reaction
 Word equation
 Formula equation
 Stoichiometry of the equation
 Using equations for mass calculations
 Examples
- 5.3. **Reaction types**
 Decomposition
 Neutralisation
 Displacement
 Precipitation
 Oxidation and reduction
 Exothermic and endothermic
 Reversible and irreversible

Chapter Six **Quantitative aspects of chemical reactions**

- 6.1. **Atomic and molecular masses**
 Conservation of mass
 Relative atomic mass
 Relative molecular mass
 Calculating percentage composition
- 6.2. **Mole**
 The mole concept
 Avogadro's number
 Calculating numbers of moles
 Empirical formula and percentage composition
- 6.3. **Using the mole concept**
 Reacting quantities
 Stoichiometric calculations
 Molar volume
 Volume changes in gas reactions
 Concentration (molarity)
 Calculations

Chapter Seven**Acids, bases and salts**

- 7.1. Properties of acids
 - Examples of common acids
 - Properties of acids
 - Dissociation with the formation of hydrogen ions
 - Strong and weak acids
- 7.2. Properties of bases
 - Examples of common bases
 - Properties of bases
 - Dissociation with the formation of hydroxide ions
 - Strong and weak bases
- 7.3. Indicators and pH
 - Indicators
 - The ph scale
 - Ph meters
 - Identifying strong/weak acids/alkalis with the use of indicators and ph meter
- 7.4. Neutralisation
 - Neutralisation reactions
 - Balancing neutralisation reactions
 - Naming of salts
 - Practical uses of neutralisation
- 7.5. Salts
 - Salts as neutralisation products
 - Properties of salts
 - Dissociation of salts
 - Salts as electrolytes
- 7.6. Acid and alkali reactions
 - Basic properties of metal oxides
 - Acidic properties of non-metal oxides
 - Reaction of acids with metal oxides and hydroxides
 - Reaction of alkalis with non-metal oxides
 - Reaction of acids with carbonates and hydrogen carbonates
 - Reaction of acids with ammonia
- 7.7. Acid/base titration: a quantitative application of the neutralisation reaction
 - Concept of titration
 - Equipment
 - Use of indicators
 - Sample titration and calculation

Chapter Eight**Water and water solutions**

- 8.1. Properties of water
 - Structure of the water molecule
 - Polarity
 - Water as a solvent
 - Electrolytic dissociation
 - Unique properties of water
 - Test for water
- 8.2. Solubility in water
 - Solubility of gases
 - Solubility of solids
 - Crystallisation

- Precipitation
- Preparation of water-soluble and water-insoluble salts

- 8.3. Colloids and emulsions
 - Suspensions
 - Dispersion medium and disperse phase
 - Colloidal mixtures – examples
 - Emulsions
 - Gel coagulation
- 8.4. Natural water
 - Temporary and permanent hardness
 - Removal of hardness
 - Purification of tap water
 - Processing of waste water
 - Desalination of seawater
- 8.5. Washing in water
 - Soaps
 - Detergents
 - Cleaning action of soaps and detergents

Chapter Nine**The periodic table and chemical properties of the elements**

- 9.1. Periodic table
 - Development of the periodic table (law of octaves; Mendeleev)
 - Structure of the periodic table
 - Relation of group and period number to electron configuration
 - Placement of metals and non-metals in the periodic table
- 9.2. Noble gases. Group 8 (or 0)
 - The elements
 - Electron configurations
 - Physical properties
 - Chemical inertness
 - Uses of noble gases
- 9.3. Alkali metals. Group 1
 - The elements
 - Electron configurations
 - Chemical reactivity
 - Physical properties
 - Variation of chemical and physical properties down the group
- 9.4. Reactions of alkali metals
 - Reactions with water
 - Reactions with halogens
 - Properties of halides
 - Reaction with oxygen
 - Alkaline properties of hydroxides and oxides
 - Uses of alkali-metal compounds
- 9.5. Alkaline earth metals. Group 2
 - The elements
 - Electronic configurations
 - Physical properties
 - Variation of physical properties down the group
 - Reactions with water
 - Reactions with air
 - Reactivity changes down the group

- Reactivity as compared to alkali metals
- 9.6. Halogens. Group 7
- The elements
 - Physical properties
 - Electron configurations
 - The structure of X_2 molecules
 - Variation of physical properties down the group
- 9.7. Reactions of halogens
- Reactivity of halogens
 - Variation of reactivity down the group
 - Reactions with hydrogen
 - Acidic properties of hydrogen halides
 - Hydrochloric acid
 - Reactions with metals
 - Halogen displacement reactions
 - Uses of halogens
- 9.8. Transition metals
- Position in the periodic table
 - Elements
 - Physical properties
 - Examples
 - Transition metal ions
 - Colours of metal salts
 - Transition metals as catalysts
 - Other uses of transition metals

Chapter Ten

Reactivity of metals

- 10.1. Reactivity series
- Reactivity order based on reactions with dilute hydrochloric acid
 - Reaction of metals with water and steam
 - Reaction of metals with oxygen
 - Noble metals
- 10.2. Predicting reactions involving metals
- Displacement reactions
 - Extraction from ores
 - Reactions of salts with metals
 - Corrosion
 - Sacrificial protection
- 10.3. Electrochemical cells
- Construction of a cell
 - Electrode reactions
 - Use of cells – batteries
 - Fuel cells

Chapter Eleven

Electrolysis

- 11.1. Conductivity of electrolytes
- Conductivity
 - Electrolytes
 - Migration of ions
- 11.2. Electrolysis
- Electrolytic apparatus

- Ions present in molten salts and aqueous electrolyte solutions
 - electrode reactions
 - Predicting electrolysis products
- 11.3. Uses of electrolysis
- Metal extraction
 - Brine electrolysis
 - Electroplating
- 11.4. Quantitative aspects of electrolysis
- Current and amount of charge
 - Electrolysis calculations

Chapter Twelve

Organic chemistry

- 12.1. Alkanes
- The concept of hydrocarbons
 - Homologous series
 - Names
 - Non-reactivity
- 12.2. Isomerism of alkanes
- Isomerism
 - Examples: building isomers
 - Comparing physical properties of linear and branched alkanes
- 12.3. Alkenes
- Unsaturated hydrocarbons
 - Reactivity of alkenes
 - Saturation and addition reactions
 - Hardening natural oils
- 12.4. Alcohols
- Methanol and ethanol
 - Physical properties
 - Toxicity of methanol and ethanol
 - Preparation of ethanol
 - Reactions of ethanol: dehydration, reaction with sodium
 - Uses of ethanol: fuel, alcoholic drinks, fermentation to vinegar
 - Other alcohols
- 12.5. Carboxylic acids
- Ethanoic acid, component of vinegar
 - Acid dissociation
 - Ethanoates
 - Ester formation, uses of esters

Chapter Thirteen

Chemical reactions

- 13.1. Endothermic and exothermic reactions
- Energy transfer
 - Endothermic reaction
 - Exothermic reaction
 - Constructing energy diagrams
 - Energy calculations

13.2. Reversible reactions and chemical equilibrium

- Irreversible and reversible reactions
- Thermal decomposition reactions
- Equilibrium point
- Examples, e.g. The haber process
- Factors affecting the direction of net reaction

13.3. Reaction rate

- Definition
- Examples of fast and slow reactions
- The concept of reaction rate as a
- Change in concentration in time

13.4. Factors affecting reaction rate

- Collision theory concept
- Concentration
- Pressure
- Temperature
- Surface area
- Catalysts (definition only)

13.5. Catalysts

- Definition
- Activation energy
- Catalysts and activation energy
- Catalysts in industrial practice
- Reducing reaction time reduces costs
- Slowing down undesirable reactions

13.6. Enzymes – biological catalysts

- Definition
- Conditions for enzymatic reactions
- Uses of enzymes
- Fermentation

Chapter Fourteen

Useful products from organic sources

14.1. Fossil fuels and crude oil

- Coal
- Crude oil
- Gas
- Origin of fossil fuels
- Crude oil deposits
- Extraction
- Uses of crude oil

14.2. Composition and separation of crude oil

- Components of crude oil
- How the size of the molecule affects the physical properties of the component
- The concept of distillation
- Fractionating column
- Fractions obtained from oil
- Uses of particular fractions

14.3. Cracking

- Need for cracking of higher hydrocarbons
- Cracking process – explanation
- Cracking products
- Cracking experiment in the laboratory

14.4. Combustion

- Combustion of fossil fuels as the main source of energy
- Combustion products
- Experiment

Incomplete combustion

14.5. Polymerisation

- The concept of a polymer
- Types of polymer
- Examples of polymerisation
- Addition and condensation polymers
- Thermoplastics and thermosets
- Uses of polymers

14.6. Environmental impact of oil products

- Oil leaks
- Plastic litter, polymer recycling
- Greenhouse effect
- Soot and carbon monoxide
- Acid rain

Chapter Fifteen

Useful products from rocks

15.1. Metals from metal ores

- Composition of the Earth's crust
- Ores
- Examples of ores
- Ore deposits
- Metal extraction methods: reduction and electrolysis
- Choosing which extraction method to use

15.2. Iron

- Iron ores
- Iron extraction process
- Steel production (oxygen furnace)
- Uses of iron
- Corrosion
- Preventing corrosion

15.3. Aluminium

- Aluminium ores
- Aluminium extraction process
- Aluminium uses
- Anodising

15.4. Copper and titanium

- Copper extraction
- Copper purification (electrolytic process)
- Copper properties and uses
- Titanium properties
- Titanium ores
- Titanium extraction process
- Titanium uses

15.5. Industrial uses of limestone

- Limestone, chalk and marble
- Quicklime manufacturing
- Slaked lime manufacturing
- Mortar hardening
- Cement manufacturing
- Cement properties and uses
- Glass manufacturing
- Glass processing
- Uses of glass

15.6. Sulphur and sulphuric acid

- Sulphur sources
- Sulphur extraction
- Sulphur properties
- Sulphuric acid – properties
- Manufacturing sulphuric acid

Uses of sulphuric acid
Sulphur oxides as pollutants

Chapter Sixteen

Useful products from air

16.1. Air

Composition of air
Separation of main components of air
Important micro-components of air: carbon dioxide, water (steam), impurities

16.2. Ammonia and nitric acid

Properties of nitrogen
Synthesis of ammonia from nitrogen and hydrogen
The Haber-Bosch process for the industrial-scale oxidation of ammonia
Nitric acid manufacturing on an industrial scale

16.3. Fertilisers

Plant requirements for fertilisers
Fertilisers
Environmental issues from the use of nitrogenous fertilisers

Chapter Seventeen

Food and drugs

17.1. Carbohydrates

Sugars
Starch and cellulose
Energetic function
Sources
Biosynthesis

17.2. Proteins

Structure
Sources
Function
Tests for proteins

17.3. Fats

Structure
Sources
Saturated and unsaturated fats
Functions

17.4. Vitamins, drugs and food additives

Water-soluble and oil-soluble vitamins
Importance of vitamins
Consequences of vitamin deficiency
Natural medicines
Synthetic medicines
Aspirin, antibiotics, antacids
Types of food additive

Chapter Eighteen

Chemistry and the Earth

18.1. The structure of the Earth

Crust
Mantle
Core (outer and inner core)
Origin of magnetic field

18.2. Tectonic plates

The crust as separate plates floating on the surface of magma
Continental drift: from pangea to contemporary continents
Evidence for the movement of tectonic plates
Mechanism of plate movement
Evidence for historical changes in the magnetic field

18.3. Tectonic plate movement, earthquakes and volcanoes

Constructive boundaries
Destructive boundaries, earthquakes and volcanic activity
Conservative boundaries and earthquakes
Map of boundaries, regions of enhanced earthquake and volcanic activity

18.4. Igneous rocks

Volcano
Formation of igneous rocks
Extrusive and intrusive rocks
Experiment illustrating the difference between intrusive and extrusive rocks
Properties of igneous rocks
Examples

18.5. Sedimentary rocks. Part 1

Weathering
Transportation
Erosion
Sediment from weathering
Sediment from the remnants of living organisms

18.6. Sedimentary rocks. Part 2

Sedimentary rock formation
Properties and examples of sedimentary rocks
Age of rock layers
Movement of rock layers
Fossils and the dating of rock layers

18.7. Metamorphic rocks and rock cycle

Formation of metamorphic rocks
Examples and properties of metamorphic rocks
Rock cycle – summary of the knowledge of rock formation and weathering

18.8. Atmosphere

Evolution of the contemporary atmosphere
Structure of the atmosphere

18.9. Radicals and ozone layer depletion.

Radicals
Ozone-layer depletion
Harmful effects of radicals

18.10. Oceans

Origin of the oceans
Origin of salts in water
Salt equilibrium
Phytoplankton

18.11. Matter cycles on earth

Water cycle

Carbon cycle
Nitrogen cycle

Chapter Nineteen

Laboratory techniques and analytical tests

19.1. Handling liquids

- Transferring liquids
- Smelling a chemical
- Mixing and stirring
- Using indicator paper
- Measuring with a cylinder
- Pipetting
- Using a burette

19.2. Handling solids. Heating

- Transferring solids
- Grinding in a mortar
- Weighing on the laboratory balance
- Filtering
- Using a Bunsen burner
- Heating materials in test-tubes
- Measuring a temperature
- Evaporating a liquid

19.3. Handling and testing for gases

- Collecting gas
- Testing for gases
- Burning a substance in a gas

19.4. Testing for ions

- Flame tests
- Reactions of cations with sodium hydroxide solution
- Tests for carbonate, sulphate, sulphite, halides

Chapter Twenty

Safety in the chemical laboratory

20.1. Hazards in the chemical laboratory and protective measures

- Fire hazards
- Health hazards (harmful substances)
- Electrocution hazards
- Hazard signs
- Laboratory coats and glasses
- Safety tips
